Wrap-Up (Examining Relationships)

You have now completed the sections on examining relationships, which is the second half of the Exploratory Data Analysis unit. You've learned how to explore the relationship between the explanatory and response variables using visual displays and numerical measures, and how to choose what kind of measure to use based on the role-type classification of the two variables. The module emphasized how important it is to interpret any observed association in the context of the problem, but NOT to be tempted to interpret association as causation, due to the possible presence of lurking variables.
